

Hung Man Hong, Marlboro

Year 2 Student of Associate of Science in Information Systems Development

The programme I am now doing, the Associate of Science in Information Systems Development, not only equips me with the practical knowledge of computing fundamentals, it also covers management and planning skills associated with the computing profession. The programme requires me not only to comprehend, but also to develop, an information system which I always thought was an easy task in the past. I used to criticize those systems for their faulty procedures and poor interface but my learning experience in the programme has made me understand that developing information systems is not an easy task at all. It does require lots of resources and efforts. I find the tasks a real challenge! I felt frustrated when I failed to obtain the expected results, but extremely delighted when problems got resolved. So far, I have been lucky to have met many enthusiastic teachers as well as a group of good classmates – they have indeed given me a great deal of confidence in completing this very challenging programme!
