Abstract:
Information technology often invokes either imagination about a 'high-tech' and rosy future or fear about an all-powerful technology world. As modern communication technologies, information technology has associated much less frequently with the discussion about mass media. In the realm of media education, there is a growing awareness about the impact of information technology on the patterns of consumption of media of our youth. What is more notable, however, is the potential information technology allows young people in the production of their own media. In both aspects, that is, the consumption and production, information technology will bring new issues to media educators.
