Urbanization

World

50 % in 2007
54 % in 2014
66 % in 2050

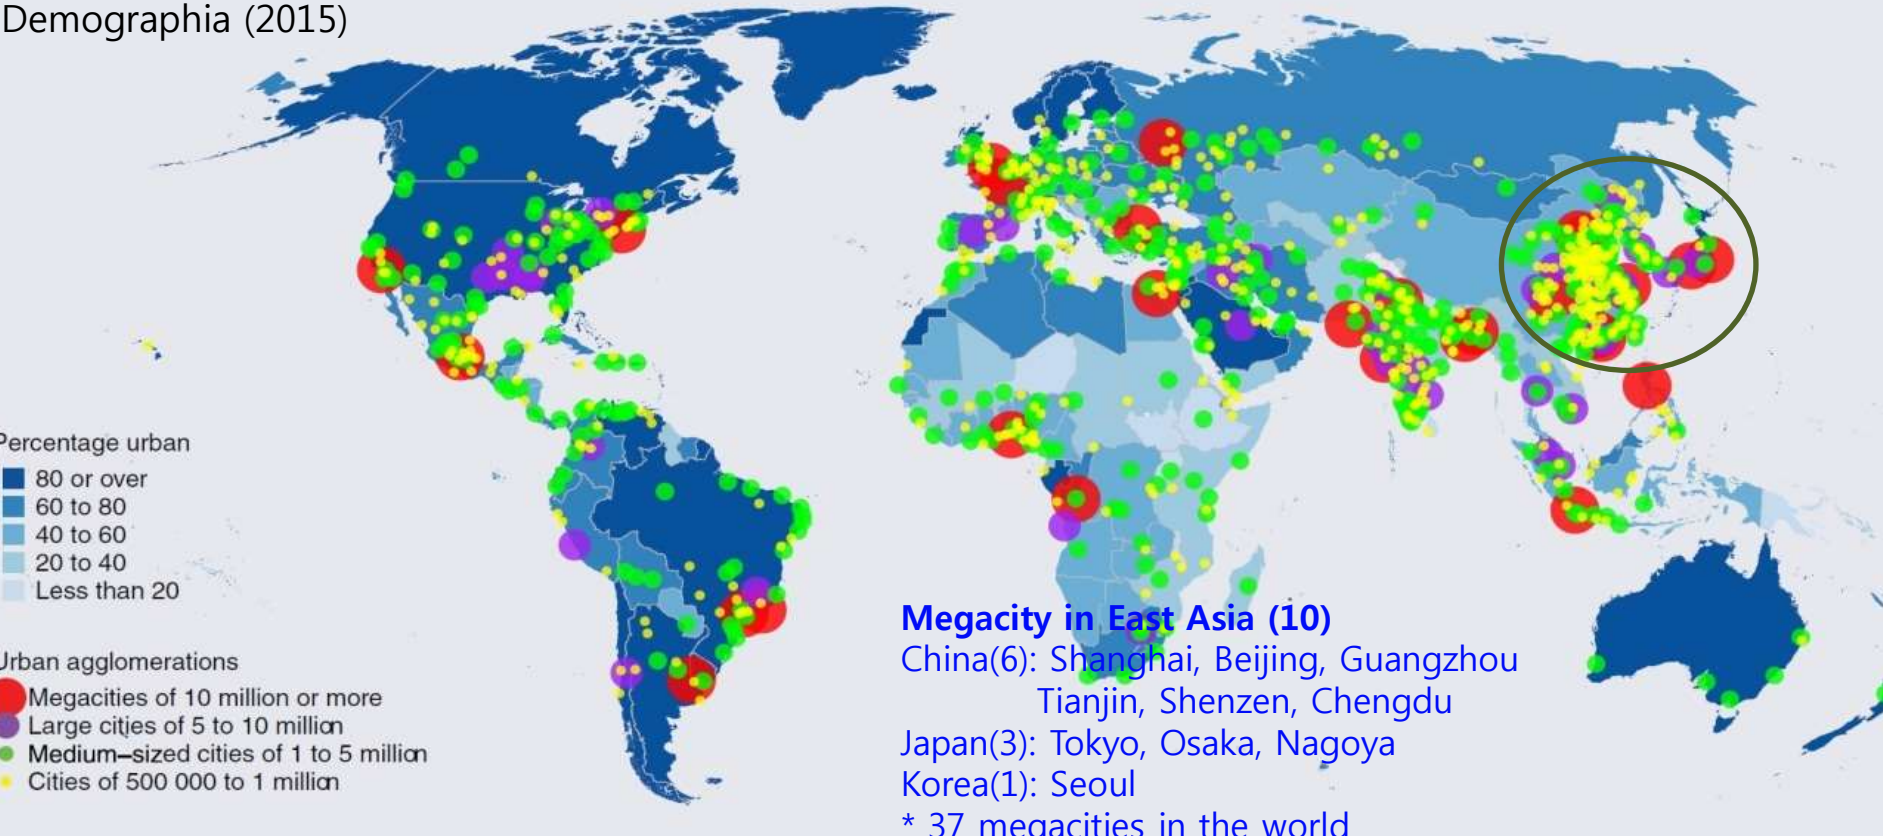

(UN: World urbanization prospects: The 2014 revision)

Percentage of population residing in urban areas

China 54 %
Korea 82 %
Japan 93 %
Hong Kong 100 %
Macau 100 %
Singapore 100 %

Demographia (2015)

Largest urban areas in the world: 2016

Urban Area	Population (million)	Urban Area	Population (million)
Tokyo-Yokohama	37.9	Shanghai	23.4
Jakarta	31.8	Mumbai	22.9
Delhi	26.5	New York	21.4
Manila	24.2	Sao Paulo	20.9
Seoul-Incheon	24.1	Beijing	20.4
Karachi	23.5	Hong Kong (51th)	7.3

Effects of urban on meteorology

Temperature and humidity

- Temperature $\uparrow \uparrow$
- Humidity/evaporation $\downarrow \downarrow$

Weather phenomena

- Haze, cloud, precipitation \uparrow
(Urban center, downwind)
- visibility \downarrow

Wind/Turbulence

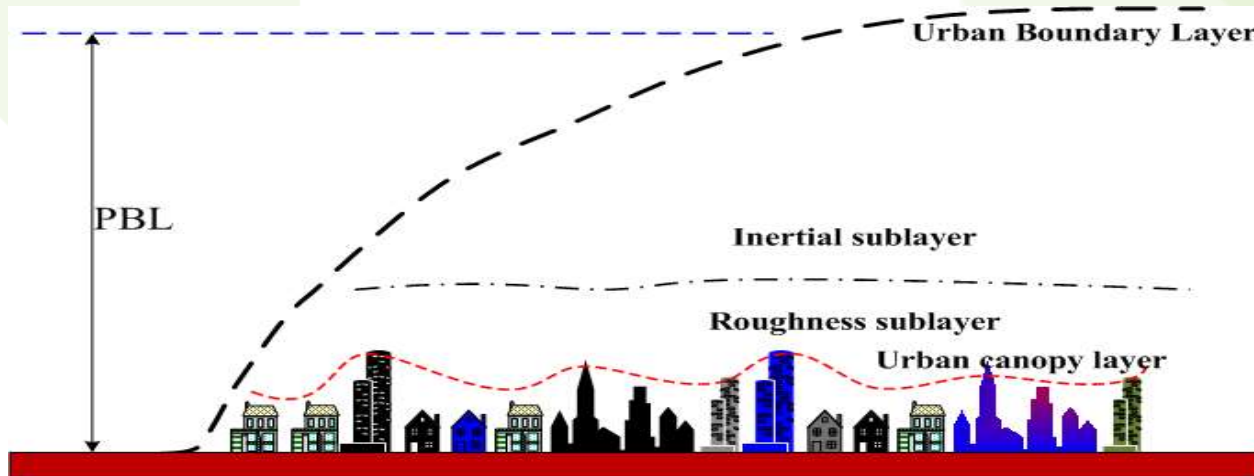

- Turbulence Intensity $\uparrow \uparrow$
- Wind speed $\downarrow(\uparrow)$ when strong(weak)
synoptic-scale wind dominants

Energy

- Solar radiation (UV) \downarrow
- Sensible Heat flux/Heat storage $\uparrow \uparrow$

Precipitation according to wind

- Calm: Strong heat island \rightarrow Convergence
(center) \rightarrow Max. Precipitation in urban center
- Weak wind: Weak convergence \rightarrow Max. Preci.
in downwind region
- Strong wind: Divergence (upwind),
Convergence (downwind) \rightarrow Max.
precipitation in downwind region

Impervious surface \rightarrow Amplify flash flooding under heavy rainfall condition

Urban material (concrete, asphalt), Energy use \rightarrow Urban heat island and anthropogenic heat release

High-rise building \rightarrow Increase roughness and turbulence, and modify wind fields

Urban-rural circulation, aerosol emission \rightarrow Modify precipitation intensity and area

Severe storms with lightning and high-speed wind \rightarrow Cause power failure

Severe haze and mist events \rightarrow Increase mortality of respiratory patients

Centum City in Busan flooded in 2009

Gwanghwamun flooded in 2010

Gangnam flooded in 2011

"Due to unexpected heavy rainfalls....."

Woomyeon Mt., 2011

Repeated hazardous extreme weather phenomena at urban area

Black-ice/Smog

Haze/mist events

Strong wind

Urban planning

User-specific Meteorological Information

Urban resilience and sustainability

Weather Information Service Engine (WISE)

- **Vision: Urban resilience and Sustainability**
- **Purpose:** (1) User-specific meteorological information service, (2) Scientific advances in urban scale (meso- γ to micro- β scale, *terra incognita* or gray-zone problem) meteorology
- **Service:** urban heat island, flash flood, road weather(ice, wetness), urban planning, urban ecology, energy use, agriculture, air quality
- **Observation platform (UMS-Seoul):** In-situ observation (above 1000 stations), surface energy balance (flux) (14 stations), ground-based remote sensing (6 wind lidars, 9 radiometers, 2 ceilometers, 2 aerosol lidars), radar (7 stations), wind profiler (2 stations), rawinsonde (2 stations)
- UMS-Seoul + multi-scale and ensemble meteorological model + service oriented application model + data platform → **Weather Information Service Engine**

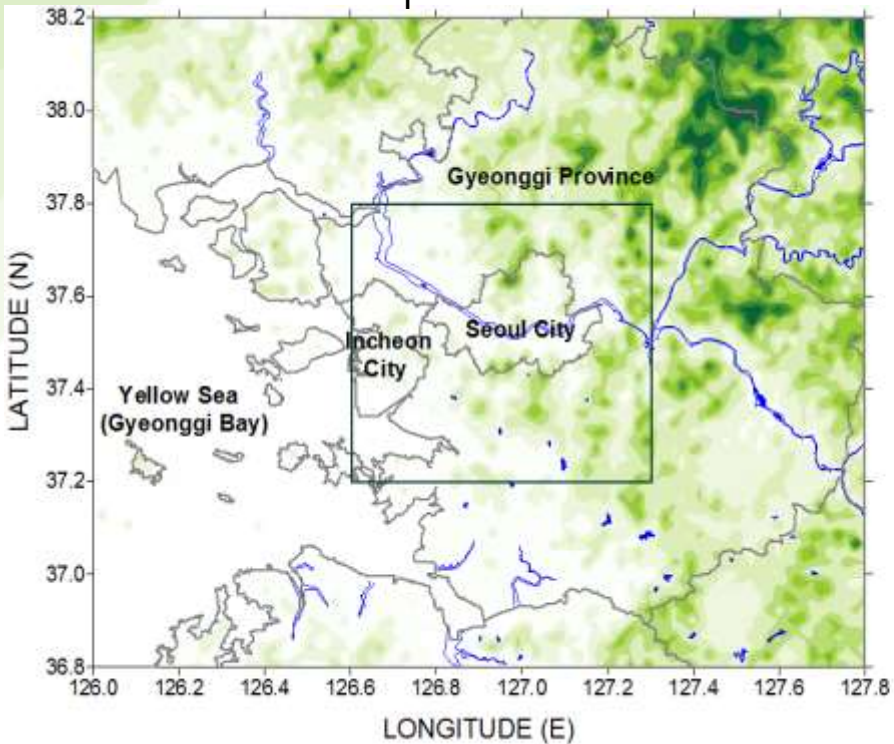

UMS-Seoul

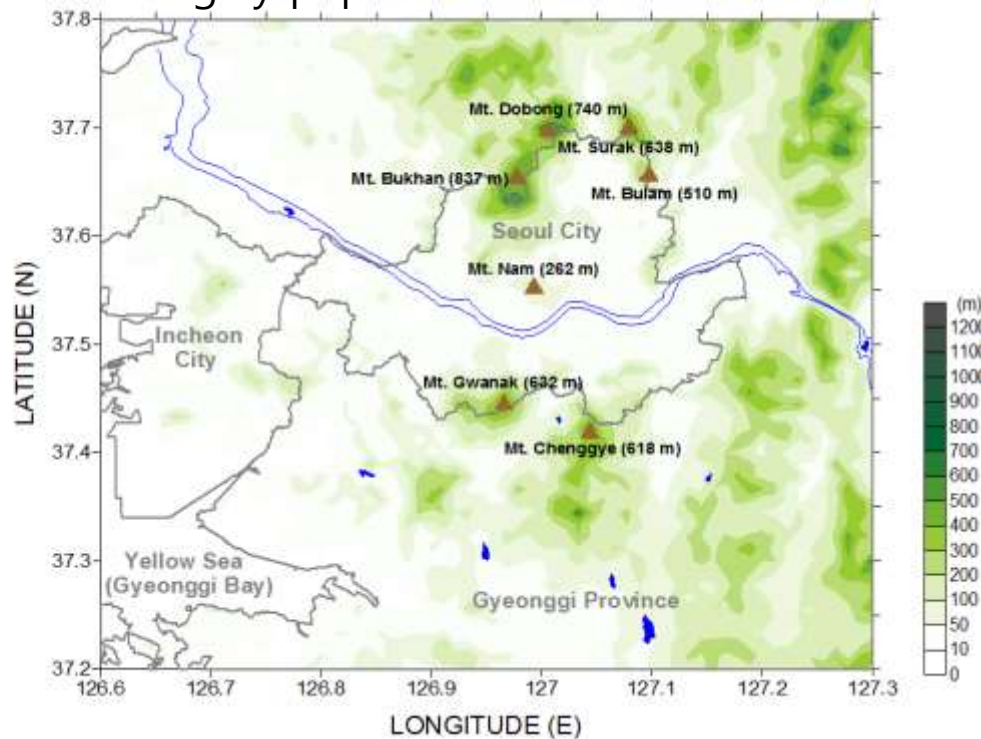

**(High-resolution urban meteorological observation system
networks in the Seoul Metropolitan Area)**

Complexity of Geography and Topography in Seoul

Seoul Metropolitan Area

Highly populated Area in the SMA

	Seoul	Incheon	Gyeonggi
Area (km ²)	605	1,010	10,184
Population	9,794,304	2,662,500	11,379,459
Population density (km ⁻²)	16,188	2,588	1,119

Mountain	Height	Mountain	Height
Bukhan	837 m	Cheonggye	618 m
Dobong	740 m	Bulam	510 m
Surak	638 m	Nam	262 m
Gwanak	632 m		

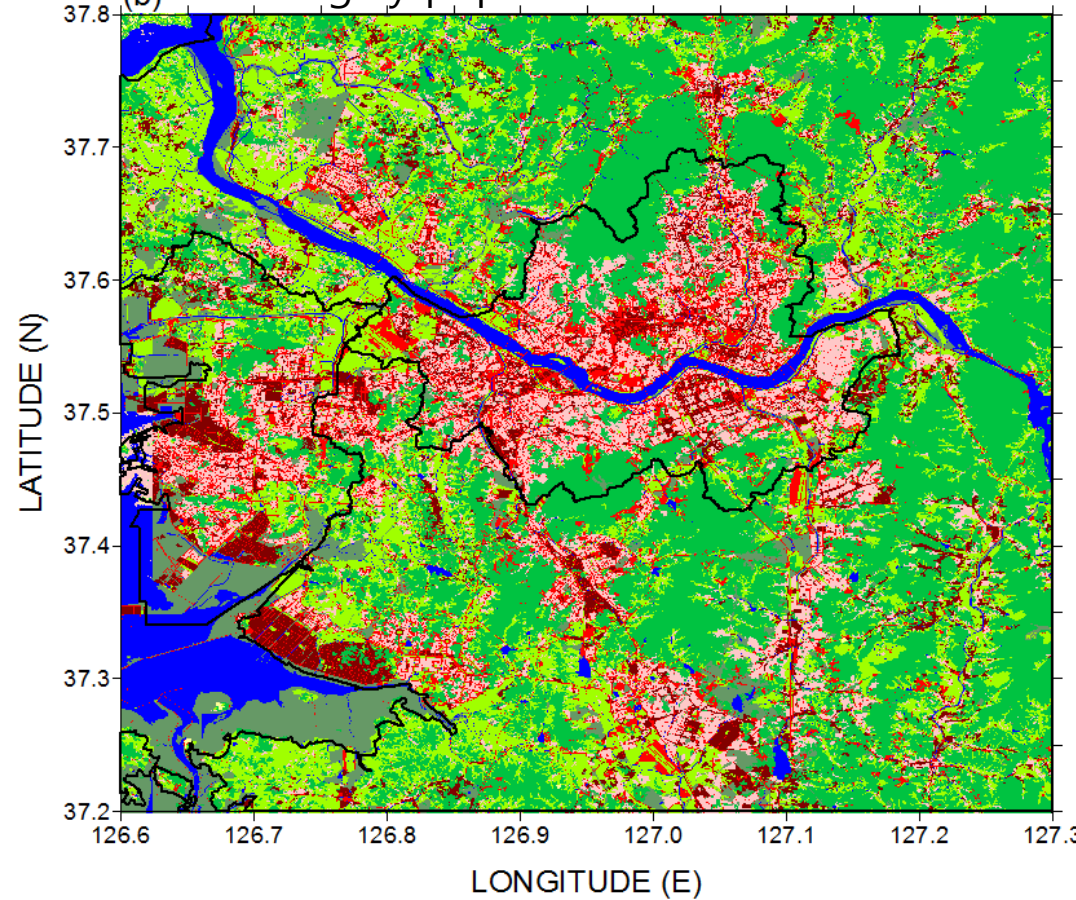

Complexity of Seoul land cover

(a) Seoul Metropolitan Area

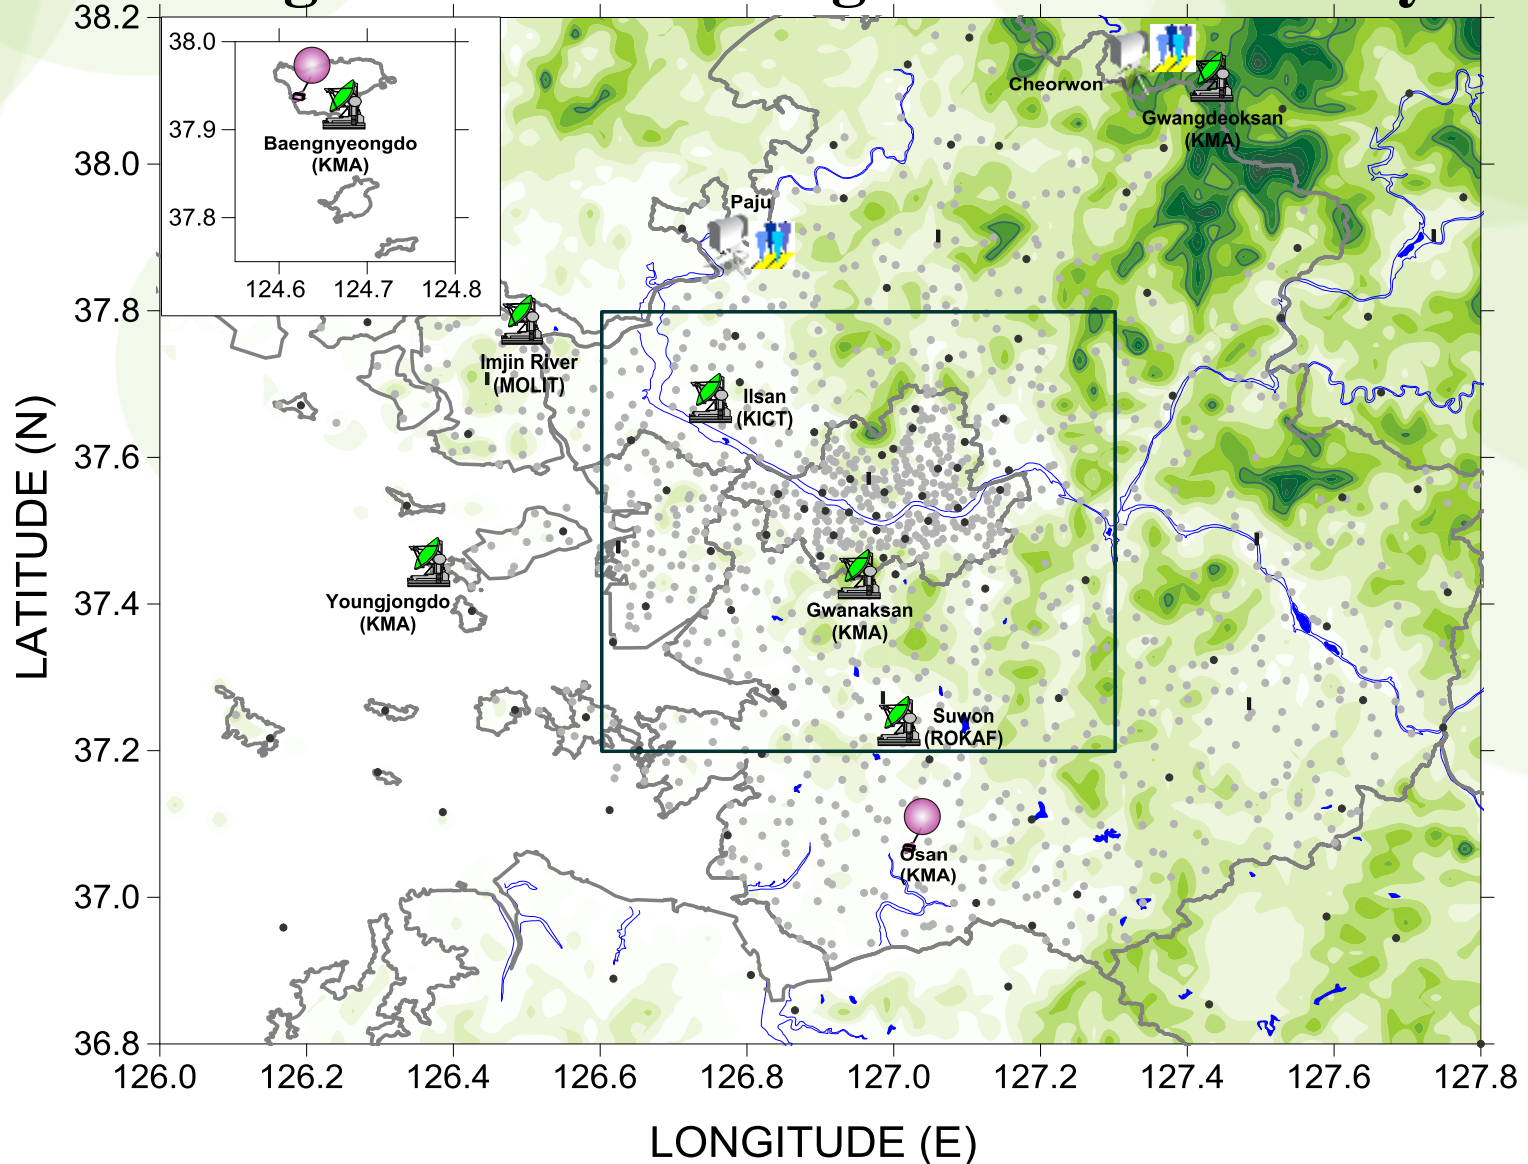

- Cropland, Pasture, Grassland
- Mixed Forest
- Water Bodies
- Wetlands
- Barren
- Low Intensity Residential
- High Intensity Residential
- Industrial and Commercial

(b) Highly populated Area in the SMA

Boundary Layer Structure

Summary

- The UMS-Seoul (high-resolution Urban Meteorological observation system networks in the Seoul Metropolitan Area) is one of the most intensively integrated and well-organized urban meteorological observation networks to deliver high-quality meteorological information customized for users' demands for the purpose of urban resilience and sustainability in the Seoul Metropolitan Area.
- The UMS-Seoul incorporates 14 surface energy balance (EB) systems, 7 surface-based three-dimensional (3-D) meteorological observation systems, applied meteorological observation systems, and the existing surface-based meteorological observation network.
- The SMA is strongly affected by the local circulation such as land-sea breeze, urban-rural breeze. That is, the westerly winds (sea breeze) are dominant from afternoon to early evening, while easterlies (land breeze) are dominant before morning time. The higher temperature in urban areas is a strong evidence on the urban heat island, while the lower pressure in urban areas can be a convective storm track path.
- Atmospheric boundary layer structure are very complex. The mixing-layer heights show a diurnal variation with a maximum in late afternoon and a residual layer is often located over the top of mixing-layer in the evening.
- The UMS-Seoul is expected to give a key not only to produce many useful meteorological-related information in urban areas practically for reducing the damage from various disastrous weather phenomena, but also to solve the meso- γ to micro- β scale meteorological phenomena (*terra-incognita* or gray zone problem) scientifically in highly populated urban areas.

Thank You for listening!
