## Table of Content

Lesson One - Aerobic Training ..... p. $1-3$
Lesson Two - Weight Training ..... p. 4 - 5
Lesson Three - Programme Development ..... p. 6 - 8
Lesson Four - Course Assessment, Reminders and Bibliography ..... P. 9
Appendix A - Estimation of One Repetition Maximum ..... P. 10-11
Appendix B - Table for Loading Selection Assignment ..... P. 12

## Student Notes

## Lesson One

## I. The general concept of Physical Fitness

Physical Fitness is the ability to carry out daily tasks with vigor and alertness without undue fatigue and with ample energy to engage in leisure time pursuits and to meet the above average physical stresses encountered in emergency situations.

## II. Components of Health Related Fitness

2.1 Cardiorespiratory Endurance

It is the ability of heart, lung and circulatory system to supply $\mathrm{O}_{2}$ and nutrients to working muscles efficiently.
2.2 Muscular Strength \& Endurance

It refers to the ability of muscular system to perform work efficiently (such as maintaining good posture, low-back functions etc.)
2.3 Body Composition (relative leanness / fatness)

It views the body weight in terms of the absolute and relative amount of muscle and fat.
2.4 Flexibility

It is the ability to move a joint smoothly through its complete range of motion.

## III. The Classification of Aerobic and Anaerobic Exercises

| Energy System | Aerobic | Anaerobic |
| :--- | :--- | :--- |
| Oxygen | Required | not required |
| Exercise Duration | more than 3 min. | less than few min. |
| Intensity | low | high |

## IV. Program Development for Aerobic Training

4.1. Intensity

Method I: Max H.R. Formula
a. For aerobic training, heart rate is a fairly reliable indicator of how hard the body is working.
b. Determine the exercise intensity by monitoring the heart rate within the desirable Target Heart Rate Zone (THRZ).
c. The Maximal Heart Rate Formula

Max. $\mathrm{HR}=220$ - Age
THRZ = Max HR $\quad x \quad \% \quad$ Intensity ( $60 \%$ to $90 \%$ )
d. Work out your THRZ

$$
\text { THRZ }=220-\quad \text { (age) } \times(60 \% \text { to } 90 \%)
$$

## Method II : Rating of Perceived Exertion (RPE)

It is to use "Sense of difficulty" to guide your exertion level during the exercise, you may adjust your own pace if your feeling too far away from the estimated range. To improve the cardio-respiratory fitness, the most effective and safe intensity is ranging from 4 to 7 .

### 4.2 Duration \& Frequency

Keep exercising at the THRZ or training zone for at least 15 minutes, preferably a program of 30-60 minutes, 2-4 sessions per week on alternate day.

### 4.3 Type of Aerobic Exercises

Any type of activity that requires large muscle groups and to perform at moderate intensity with long duration exercise. e.g. jogging, brisk walking, distance swimming, cycling, aerobic dance, rope skipping and various game activities. The best exercise is the one you enjoy most.

Note : Popular games as tennis, badminton, squash, basketball are fine for maintaining fitness, but they may not allow you to maintain your heart rate in the training zone. You should be fit before you compete in these strenuous sports.

### 4.4 Advantages \& Disadvantages of Jogging / Running

### 4.4.1. Advantages

Jogging / Running costs little ( the only equipment it requires is a pair of running shoes and simple clothing), it has flexibility of time, year round availability and a relatively high level of benefit in return for time and effort.

### 4.4.2 Disadvantages

Because the feet and legs are subjected to repetitive pounding on the running surface, overuse injuries are very likely to accur. Most of these injuries involve the muscles, tendons, ligaments, and occasionally bones of the lower extremity.

Note : Proper running and training techniques, and properly fitted running shoes can reduce the injuries.

### 4.5 The Jog-Walk-Jog Program

| STEP | JOG | WALK | LOAD | DISTANCE JOGGED |
| :---: | :--- | :--- | :--- | :--- |
| 1 | 30 sec | 30 sec | 8 to 12 sets | $1 / 2$ to $3 / 4$ mile |
| 2 | 1 min | 30 sec | 6 to 12 sets | $3 / 4$ to $11 / 2$ miles |
| 3 | 2 min | 30 sec | 6 to 10 sets | $11 / 2$ to $21 / 2 \mathrm{miles}$ |
| 4 | 4 min | 1 min | 4 to 6 sets | 2 to 3 miles |
| 5 | 8 min | 2 min | 2 to 4 sets | 2 to 4 miles |
| 6 | 12 min | 2 to 3 min | 2 sets | 3 miles or more |
| 7 | continuous jogging for 20 to <br> 30 min | cool down <br> by walking | 2 to 4 miles |  |

## V. Use of Aerobic Training Machines

(Practical)

## Lesson Two

## I. Muscular Fitness

1.1 Training Principles for Weight / Resistance Training

### 1.1.1 Weight Selection

Training with heavier resistance builds strength whereas using lighter or moderate resistance with more repetitions are better for toning and endurance training.

### 1.1.2 Progressive Overload

Gradually increase in resistance and slightly more than it is accustomed.
1.1.3 Full Range of Motion (ROM)

Perform full range of motion from starting position to a safe ending position is recommended. Restriction of range of motion for a prolonged period of time can result in a shortening of the muscle and permanent restriction of specific movement.
1.1.4 Breathing

Exhale while exerting or lifting weight, inhale while lowering weight down.
1.1.5 Balance Musculature

Muscle groups of flexion and extension in the specific part are suggested to be trained equally. e.g. sit-up (abdominal flexion) \& back-arch (hyper-extension).

### 1.1.6 Reversibility

Training should be continuous, otherwise detraining occurs. (Use Disuse Principle)

## II. Types of Resistance Training Exercises

## $2.1 \quad$ Body Weight Exercises

These utilize body weight as resistance, low cost and easy access, but lack of progressive resistance.
2.2 Machine Exercises

Weights are already arranged in a stack. Desired weight can be selected by insertion of fixing pin.
2.3 Free-weight Exercises
a Dumbbells: are smaller, designed to be held in one hand, and exercises are usually done in pairs.
b Barbells : are longer versions of dumbbells, with a long bar to allow both hands to grip and weights added at both ends.
c E-Z Curl Bar \& Tricep Bar : provide angled gripping to allow the muscles to be worked at different angles.

## III. Safety Guidelines for Using Free-weights

3.1 Secure collars of both ends of the bar before exercising.
3.2 Beginners are strongly advised to use light weights to master all techniques.
3.3 To work in pairs, (with partner spotting) when lifting at heavy weights.
3.4 Do not drop the weights to the floor after lifting.
3.5 All equipment must be returned to their appropriate places after use.

## IV. Use of Weight Training Machines and Free Weight.

(Practical)

## Lesson Three

## I. The Three Phases of Exercises

1.1 Warm up Phase :
1.1.1 It is beneficial to joints and muscles and helps to prevent injuries and muscle soreness.
1.1.2 It includes static stretching ( holding a steady stretch with the desired muscles at their greatest possible length ) and limbering exercises to prepare the musculotendinous system.
1.1.3 Activities should include large muscle movements to gradually raise the cardiorespiratory mechanism to an intermediate level.
1.2 Conditioning Phase :
1.2.1 To determine the training objective of the entire session, the workout should be emphasized on training of muscular fitness or aerobic / cardiovascular fitness.
1.2.2 When developing an exercise program, 3 basic variables should be considered:
a. Intensity (how hard to exercise)
b. Duration (how long to exercise)
c. Frequency (how often to exercise)

### 1.3 Cool-down Phase :

1.3.1 Stopping exercise abruptly after a vigorous workout may trap a large quantity of blood in the muscles or lower parts of the body. As a result, an insufficient amount of blood circulates back to the brain or heart which may cause dizziness or faintness.
1.3.2 A gradual cool-down usually aids in the removal of accumulated metabolic wastes and may prevent cardiac arrhythmias following strenuous exercise.
1.3.3 When heart rates are near resting levels, stretching and limbering exercises may reduce the developing of delayed muscle soreness.

## II. Training Intensity for Weight / Resistance Training

### 2.1 Repetition Maximum (RM)

2.1.1 Repetition Maximum (RM) refers to the maximum number of repetitions that can be performed with a load. For example an individual can lift 10 times of a certain exercise with 100 lb loading, he is said to have a 10 RM of 100 lb .
2.1.2 One Repetition Maximum (1 RM) refers to an individual's ability to exert maximum force during a single effort, sometimes referred to the term of "strength".

### 2.1.3 Estimation of 1 RM

2.1.3.1 Use of 10 RM estimation table (Appendix A)
2.1.3.2 On-line calculation at ExRx.net http://www.exrx.net/Calculators/OneRepMax.html

### 2.2 Determination of RM

| Training Goal | Relative Loading | Repetition <br> Range | No. of <br> Sets | Rest <br> between Sets <br> Muscular Endurance Light ( $50 \%-60 \%$ of 1RM) | $12-20 \mathrm{RM}$ |
| :--- | :--- | :--- | :---: | :---: | :--- |
| $2-3$ | $15-30 \mathrm{~s}$ |  |  |  |  |
| General Conditioning | Moderate ( $60 \%-70 \%$ of 1 RM) | $8-12 \mathrm{RM}$ | $2-3$ | $30-90 \mathrm{~s}$ |  |
| Muscular Strength | Heavy $\quad(70 \%-90 \%$ of 1 RM) | $4-8 \mathrm{RM}$ | $3+$ | $2-5 \mathrm{~min}$ |  |

2.3 Loading adjustment

|  |  | Reps completed with trial load |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | >18 | 16-17 | 14-15 | 12-13 | 10-11 | 8-9 | 6-7 | 4-5 | 2-3 | <2 |
| G | 14-15 | +10 | +5 |  | -5 | -10 | -15 | -15 | -20 | -25 | -30 |
| 0 | 12-13 | +15 | +10 | +5 |  | -5 | -10 | -15 | -15 | -20 | -25 |
| 1 | 10-11 | +15 | +15 | +10 | +5 |  | -5 | -10 | -15 | -15 | -20 |
|  | 8-9 | +20 | +15 | +15 | +10 | +5 |  | -5 | -10 | -15 | -15 |
| e | 6-7 | +25 | +20 | +15 | +15 | +10 | +5 |  | -5 | -10 | -15 |
| p | 4-5 | +30 | +25 | +20 | +15 | +15 | +10 | +5 |  | -5 | -10 |
| s | 2-3 | +35 | +30 | +25 | +20 | +15 | +15 | +10 | +5 |  | -5 |
|  | Poundage increase (+) or decrease (-) |  |  |  |  |  |  |  |  |  |  |

Source from : T R Baechle, R W Earle, 1995. P. 121, Fitness weight training, Human Kinetics.
e.g . An individual wants to complete 10 reps (Goal reps) with 100 lb , but he/she is able to perform 15 reps, his/her goal reps of 10 can be reached by intersecting the column 14 to $15 \mathrm{at}+10 \mathrm{lb}$, then the adjusted load should be 110 lb for 10 reps.

### 2.4 Duration \& Frequency <br> For general conditioning, preferably 20-40 minutes per workout, 3 times per week on alternate day.

### 3.1 Definition of Circuit Training

3.1.1 Circuit Training employs a series of exercise stations that consist of various combinations of weight training, flexibility, calisthenics and brief aerobic exercises.
3.1.2 Circuits may be designed to accomplish many different training goals.
3.1.3 The series of resistance training exercise are performed one after the other with minimal rest ( $15-30$ seconds) between exercise.
Approximately 10 to 15 repetitions of each exercise per circuit at a resistance of $40 \%$ to $60 \%$ of a 1 RM .
3.1.4 A typical circuit may consist of 8 to 12 stations and the entire circuit program is preferable to be repeated 2-3 times.
3.2 Benefits of Circuit Program

Circuit Training is an effective way for improving strength and flexibility. If the pace or the time interval between stations is rapid and if workload is maintained at a high level of intensity, the cardiorespiratory system will certainly be benefited from the circuit.
3.3 Example of Circuit Program

Station 1 Treadmill running / jogging
Station 2 Stretching: Hamstring \& low back
Station 3 Bench press ( 10 reps at $50 \%$ of 1RM)
Station 4 Back arch ( 15 reps)
Station 5 Leg press ( 20 reps at $60 \%$ of 1RM)
Station 6 Bike ( 5 mins at $60 \%$ of THR)
Station 7 Lat. pull down ( 10 reps at $50 \%$ of 1RM)
Station 8 Abdominal Curl-up (20 reps)
Station 9 Leg Curl (10 reps at $50 \%$ of 1RM)
Station 10 Butterfly chest (10 reps at $50 \%$ of 1RM)
There should be a maximum of 60 seconds to complete each weight training station with minimal interval rest (15-30 seconds), and the entire circuit should be repeated 2-3 times in succession.

### 3.4 Circuit Program Practice

## VI (Practical)

## Lesson Four

## I. Course Assessment

## II. Reminder for using the Fitness Room

2.1 The Fitness Room User Card
2.2 Proper attire
2.3 Handling of equipment
2.4 Be considerate to other users

- End -

## Weight Training - Table for Loading Selection Assignment

Name: $\qquad$ Testing Date: $\qquad$

## Resistance Training Regimes (Intensity):

| Objectives | \% of 1 RM | No. of Reps | Sets | Rest |
| :---: | :---: | :---: | :---: | :---: |
| Muscular Strength | $70-90 \%$ | $4-8$ | $2-3$ | $2-3 \mathrm{~min}$. |
| General Conditioning | $60-70 \%$ | $8-12$ | $2-3$ | $1-2 \mathrm{~min}$. |
| Muscular Endurance | $50-60 \%$ | $12+$ | $3-4$ | minimal |

Based on 1 RM Estimation Chart to calculate your training loads in the 3 categories:

| Workout Station | 1 RM <br> (lb.kg.) | Strength <br> $70-90 \%$ |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  |  |  | Conditioning <br> $60-70 \%$ | Endurance <br> $50-60 \%$ |
